Digital Platforms

**DIGITAL
BUSINESS**

Learning Objectives

Digital platforms play an important role in making an organization's digital transformation journey successful.

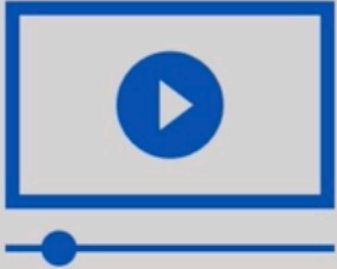

Digital Platform

Digital environment that allows users to communicate, collaborate, and share

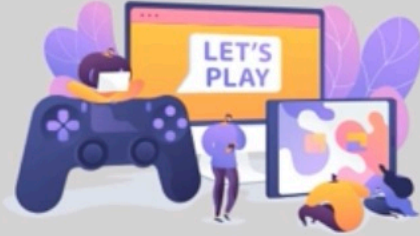

Digital Platform

Platform serves in these categories:

Videos

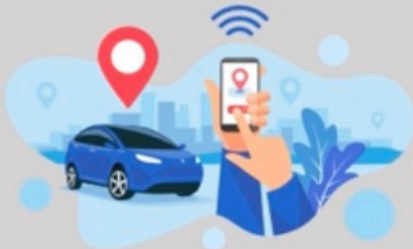

Gaming

Auctions

E-Commerce

Car Ride

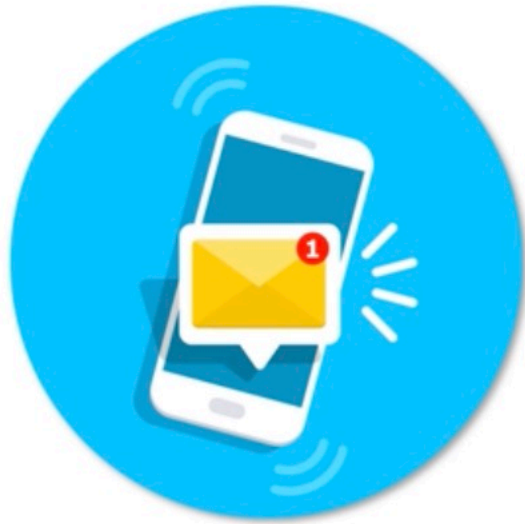

Home Rentals

B2B Businesses

Digital Platform

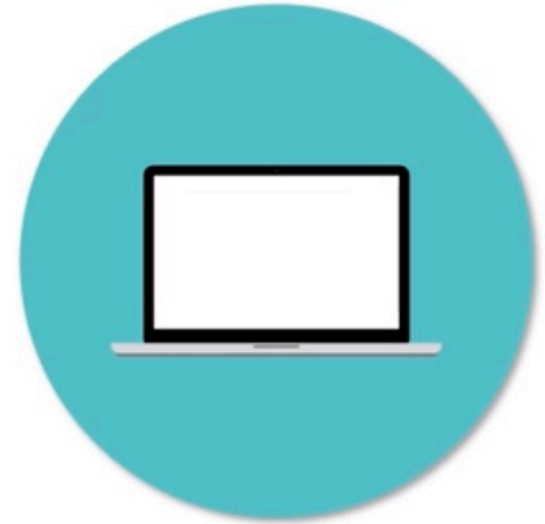

Digital platform is software that runs on the web and can be accessed from anywhere.

Smartphones

Tablets

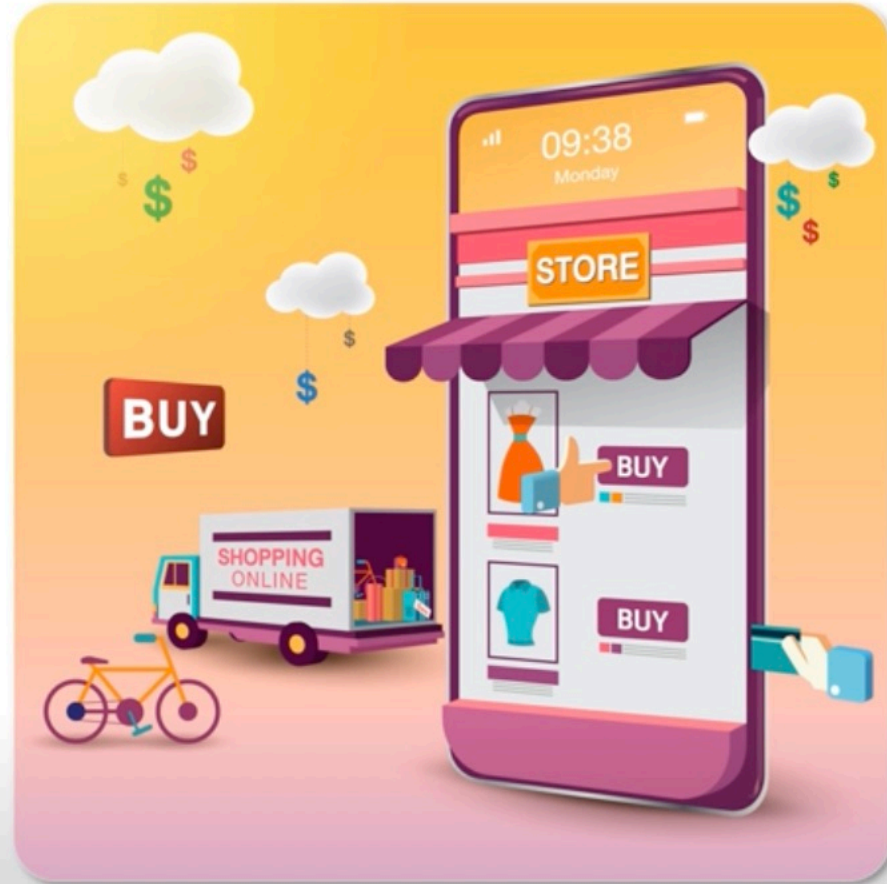

Laptops

Digital Platform

Digital Platform

Digital platform attracts customers with its services.

Examples of Digital Platforms

Provides rental accommodation for visitors in a locality

Examples of Digital Platforms

Provides road transportation services for commuters from one point to another in cities

Digital Platforms: Aggregator

Types of Digital Platforms

There are four types of digital platforms:

Aggregators

Types of Digital Platforms

Industries have derived great value from digital transformation.

Aggregators

Aggregators are organizations that bring similar products or services from different organizations into a single platform by streaming and rebranding them as their own services.

Model 1: Integration

Integration

- Aggregators consolidate the existing offerings of multiple organizations into a single platform without changing the brand name.
- Typically, there is no value addition by an aggregator to the service.

Model 1: Integration

Integration

- Example: eBay is a marketplace that brings products and services from different organizations without changing the brand.
- The business model charges margin on top of the product.

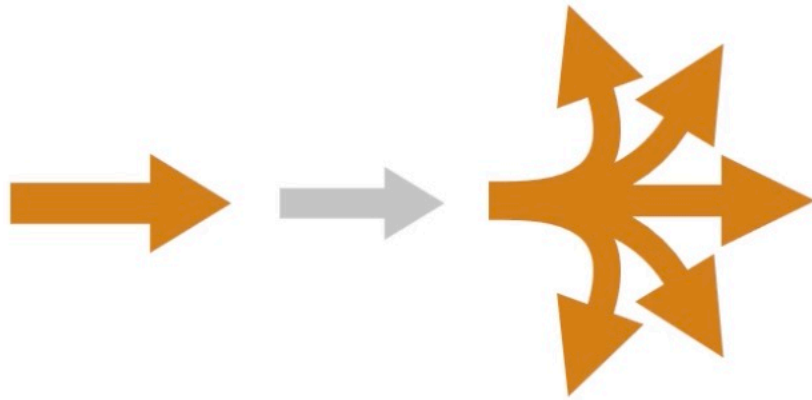

Model 2: Build

Build

Aggregator creates a new product or service under its own brand via consolidation of services right from the end supplier.

Model 3: Extend

Aggregators extend their already consolidated service to new channels.

Extend

Model 3: Extend

WEB TRAFFIC INCREASE

Extend

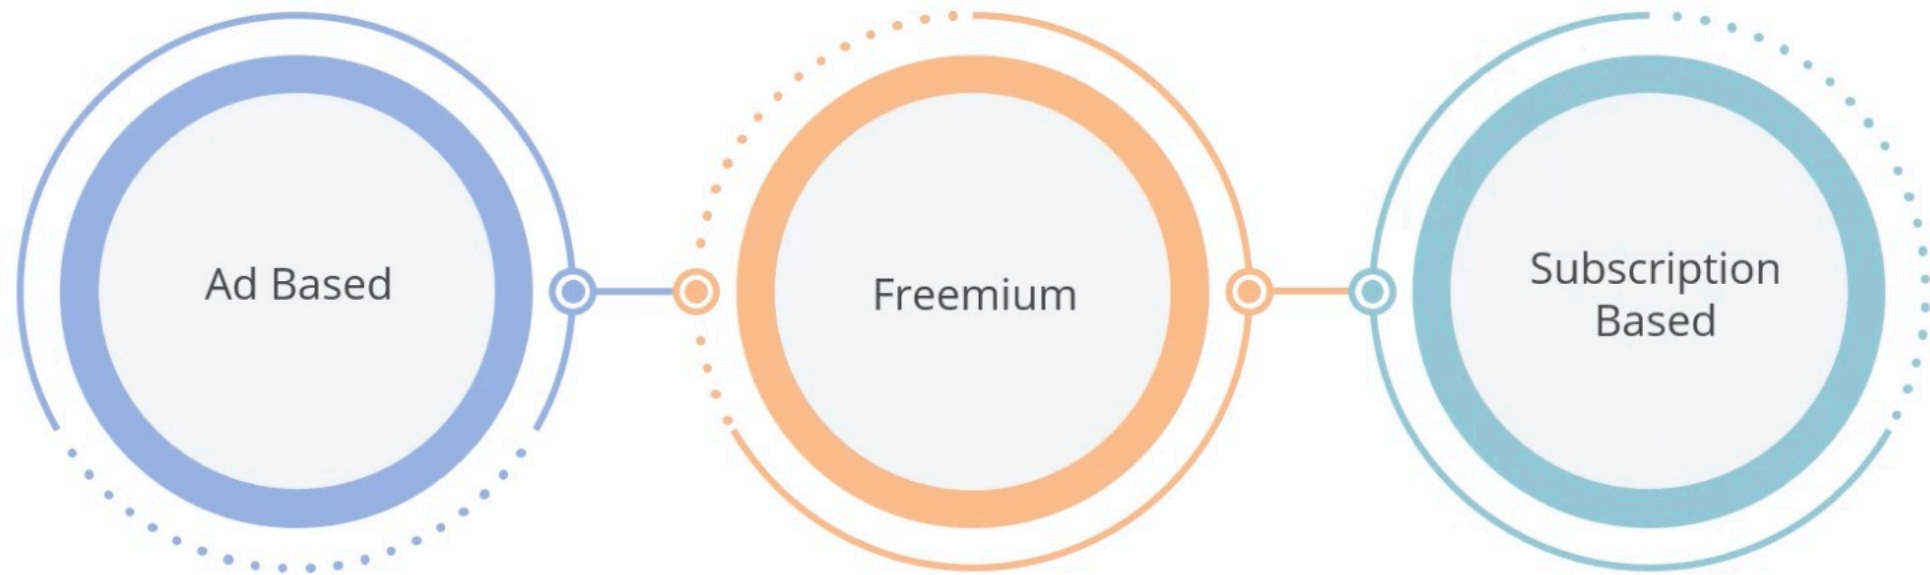

- Example: Google Ads. Google has created an ad inventory from different organizations and then extended it to different blogging websites.
- Bloggers that generate website traffic can choose Google Ads for their portals, and Google uses APIs to show ads that are consolidated.

Digital Platforms: Social, Mobilization, and Learning

**DIGITAL
BUSINESS**

Social Platforms

Platforms that bring people and community with similar interests into a single stream are called social platforms.

Ad-Based Model

In this model, the platform brings people with similar interests together, and once enough traffic is created, the platform uses ads to generate money.

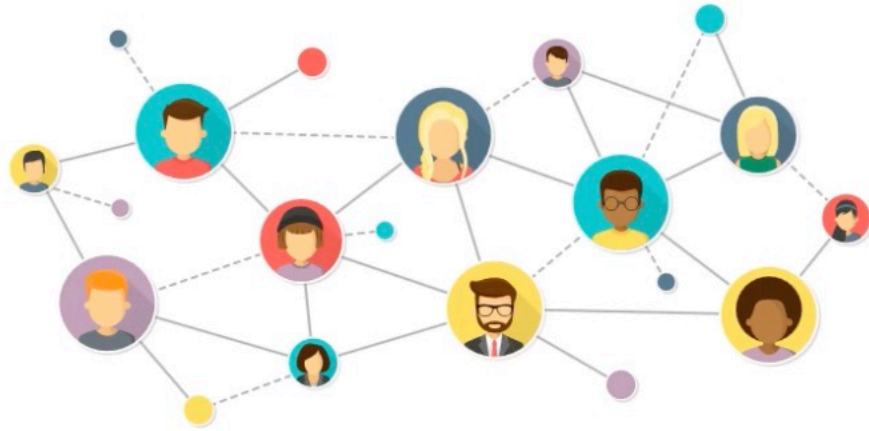

Ad-Based Model

Example: Stack Overflow has brought people with coding interest together.

Freemium Model

In this model, the platform connects two or more people in which basic services are free, but some services require upgrading to a paid version.

Freemium Model

Example: LinkedIn allows you to connect with people for free but provides additional features to paid users.

Subscription-Based Model

In this model, only subscribed users who paid a certain amount can connect to each other.

Subscription-Based Model

The logo for VYCEZ is displayed in a bold, black, sans-serif font. Each letter has a thick, bright pink outline, giving it a vibrant, neon-like appearance. The letters are closely spaced and have a slightly irregular, hand-drawn feel.

Example: VYCEZ is a subscription-based social media app.

Mobilization Platforms

These platforms mobilize a specific set of groups to solve a particular problem.

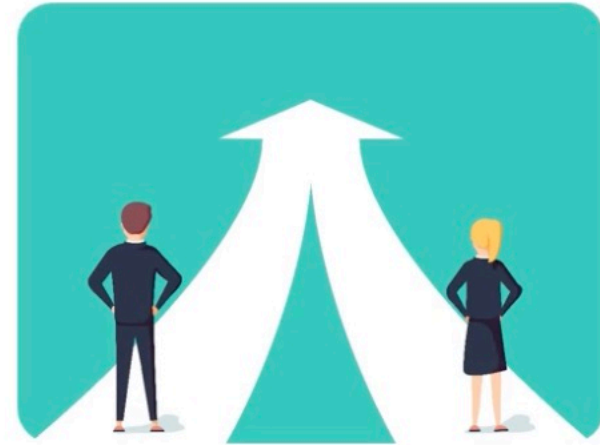

The business model of a mobilization platform is to integrate the common goals of people into a single platform.

In this model, the collective mind of people is a great tool.

Examples of Digital Platforms

If someone has a revolutionary product idea but doesn't have the investment for it, they can use Kickstarter to ask people to work toward its development by contributing money toward it.

KICKSTARTER

Examples of Digital Platforms

This kind of platform mobilizes the common interest of people to achieve a certain objective.

KICKSTARTER

Examples of Digital Platforms

This kind of platform mobilizes the common interest of people to achieve a certain objective.

Learning Platforms

Learning platforms are one of the recent evolutions of platforms where technology is expanding dramatically in the education world.

Examples of Learning Platforms

Organizations that have adopted learning platforms:

It is an American nonprofit organization which provides access to K-12 or higher secondary curriculum for free to the entire world.

- It is a massive open online course provider that has transformed the way people learn.
- Its ability to provide content across multiple channels, from websites to apps, gives users the flexibility to learn things at their own pace and through their channel of choice.

Blockchain

**DIGITAL

What Is Blockchain?

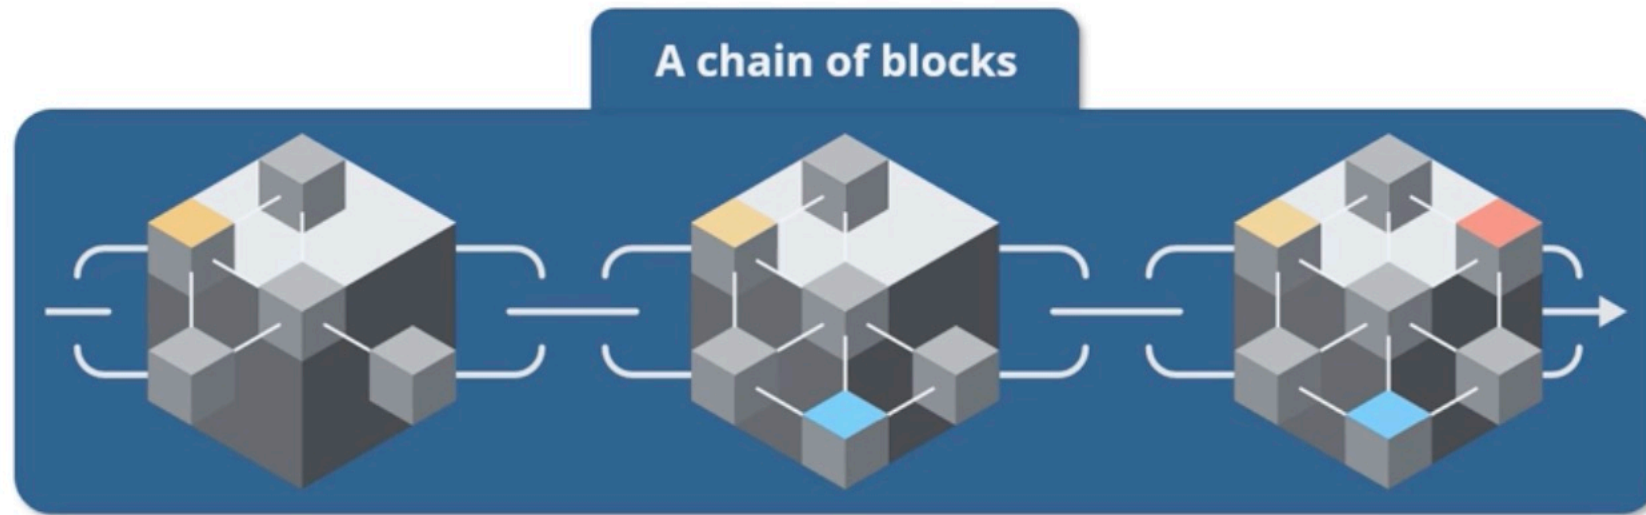

Blockchain is a decentralized, peer-to-peer digital ledger.

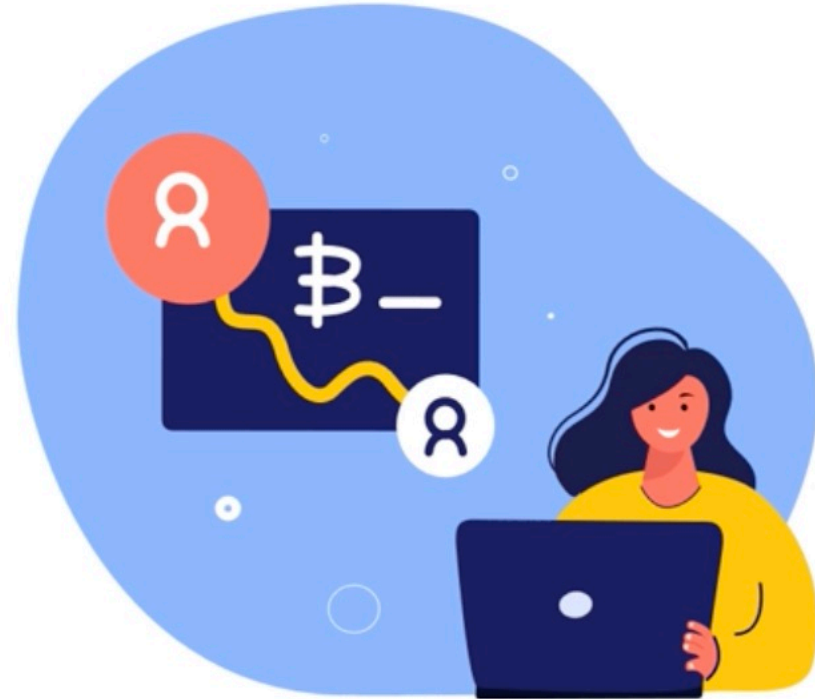

It enables transactions over the internet.

What Is Blockchain?

Several verified transactions are added to the existing chain.

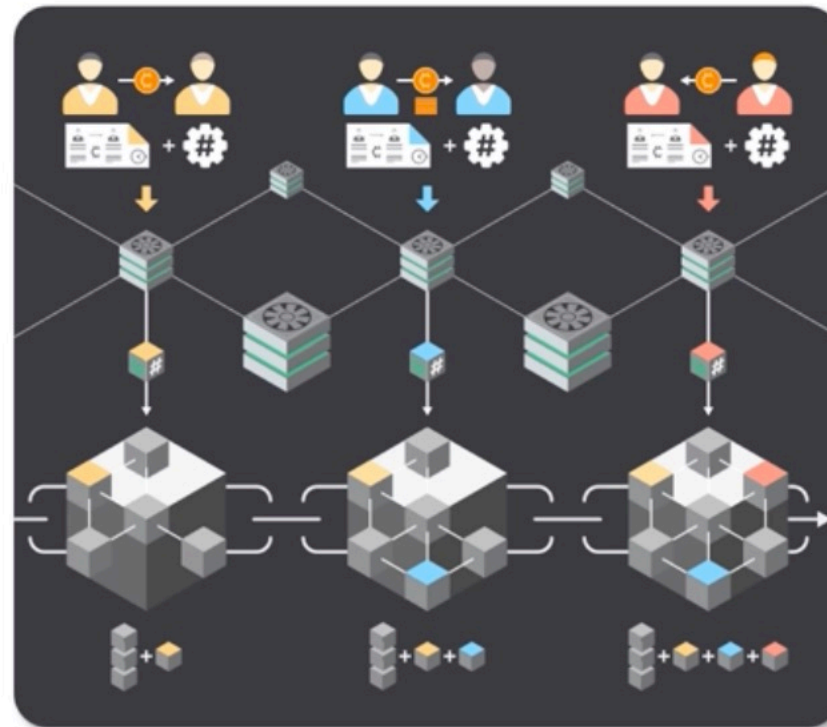

What Is Blockchain?

Blocks in a Chain

A cryptographic hash links each block with the previous one, along with details of the transaction.

Once added to the network, a block can never be modified.

Blocks in a Chain

The first block in a Blockchain network is called the *Genesis* block.
